

Introduction

- Patients often experience unease when they must visit the hospital outpatient department, as they may lack clarity about their illness, the required examinations, and the associated expenses.
- Machine learning with clinical data has long been in practice, offering substantial benefits.
- While numerous studies have explored diagnostic and support pathways for specific ailments like depression and diabetes, the application of these technologies in creating interactive self-check platforms remains less explored.
- Our project aims to:
 - a. Could analyzing medical encounter data reveal distinct patient groups with similar healthcare needs?
 - b. Could classification prediction on user-reported symptoms and health status enable the identification of potential treatment pathways in a statistical representation?

Method

Dataset

- Outpatient dataset of National Hospital Ambulatory Medical Care Survey (NHAMCS) with ICD-9-CM

Preprocessing

- Merged: by consolidating relevant columns, resulting in a dataset with 150 features.
- Splitted into training (2006-2008), validation (2009), test (2010), and evaluation (2011) sets to maintain generalizability and adaptability to data shift

Feature Engineering

- Quantitative features: Binning or normalization based on stability and sensitivity requirements.
- Categorical features: One-hot encoding
- Text features: text extracted, integrated and transformed into topic features

Machine Learning

- Employed Random Forest Classifier to predict the classification of Diseases and Injuries

Results

Features Engineering

Figure 1: Example of Word Cloud

Conclusion

- Our machine learning analysis of NHAMCS outpatient data reveals key diagnostic pathways and supports, potentially improving patient understanding before medical consultations.
- Despite time and data limitations, our promising results endorse the application of machine learning in healthcare, setting a foundation for future interactive self-check platforms.

Figure 3: Topic 20 importance features

The prominence of these features highlights the intricate interplay between demographic characteristics, vital signs, and thematic elements of patient data in our final model.

Mock up health self-check interactive simulation

User input	
AGE: 42	
SEX: male	
USETOBAC: yes	
HEIGHT (Inches): 67	
WEIGHT (Pounds): 205	
TEMPERATURE (Fahrenheit): don't know	
BLOOD PRESSURE (Systolic): don't know	
BLOOD PRESSURE (Diastolic): don't know	
HOW MANY PAST VISITS IN THE LAST 12 MONTHS? : 0	
INJURY/POISONING/ADVERSE EFFECT : none of the above	
MAJOR REASON FOR THIS VISIT : chronic problem, flare up	<p>Do you have any of the following CONDITIONS?</p> <p>Please CHECK all that apply.</p> <ul style="list-style-type: none"><input type="checkbox"/> Arthritis<input type="checkbox"/> Asthma<input type="checkbox"/> Cancer<input type="checkbox"/> Cerebrovascular disease<input type="checkbox"/> Chronic renal failure<input type="checkbox"/> Congestive heart failure<input type="checkbox"/> Chronic obstructive pulmonary disease<input type="checkbox"/> Depression<input type="checkbox"/> Diabetes<input type="checkbox"/> Hyperlipidemia<input type="checkbox"/> Hypertension<input type="checkbox"/> Ischemic heart disease<input type="checkbox"/> Obesity<input type="checkbox"/> Osteoporosis
REASON(S) FOR VISIT : labored or difficult breathing (dyspnea), disorders of respiratory sound
